

**Indonesia**

**Agenda item 10 : Space and Water  
By Ms. Yunita Permatasari**

Mr. Chair,

Indonesia emphasizes the use of satellite-based information in order to solve difficulties of maintaining water security, which has become one of the most important environmental problems in the twenty-first century.

Recently, Indonesia faces a significant challenge of runoff within the context of water management, a critical component of the water cycle. Regarding this issue, Indonesia is of the view that to ensure the successful achievement of Sustainable Development Goal 6.3.2, Earth Observation (EO) in accurate runoff monitoring is essential to detect and address the issue of polluted runoff.

Indonesia is also of the view that access to clean water and sanitation remain a fundamental goal embedded within the Sustainable Development Goals, which Indonesia diligently strives to achieve. This objective holds particular relevance in today's global landscape, where numerous nations continue to face challenges in accessing clean water. In order to reach the aims of SDG 6 and guarantee universal access to clean water and sanitation, Indonesia is fully committed to enhancing collaboration among diverse stakeholders.

Mr. Chair,

My delegation would like to inform that in 2024, Indonesia will host the 10th World Water Forum (WWF) with the a theme : "Water for Shared Prosperity".

As the first Southeast Asian nation selected to host the WWF, Indonesia is honored to convene this significant international water conference, fostering crucial dialogues on effective water management practices.

Thank You
