

# Spatio-temporal Analysis of Changes in Rainfall Regime in the Sudano Sahelian Zone of Nigeria

Muhammad Usman

Prof Janet E. Nichol

Dr Wong Man-sing Charles

UN/Pakistan/PSIPW 4<sup>th</sup> International Conference on the **“Use of Space Technology  
for Water Management”**, Islamabad, Pakistan

26 February - 2 March 2018

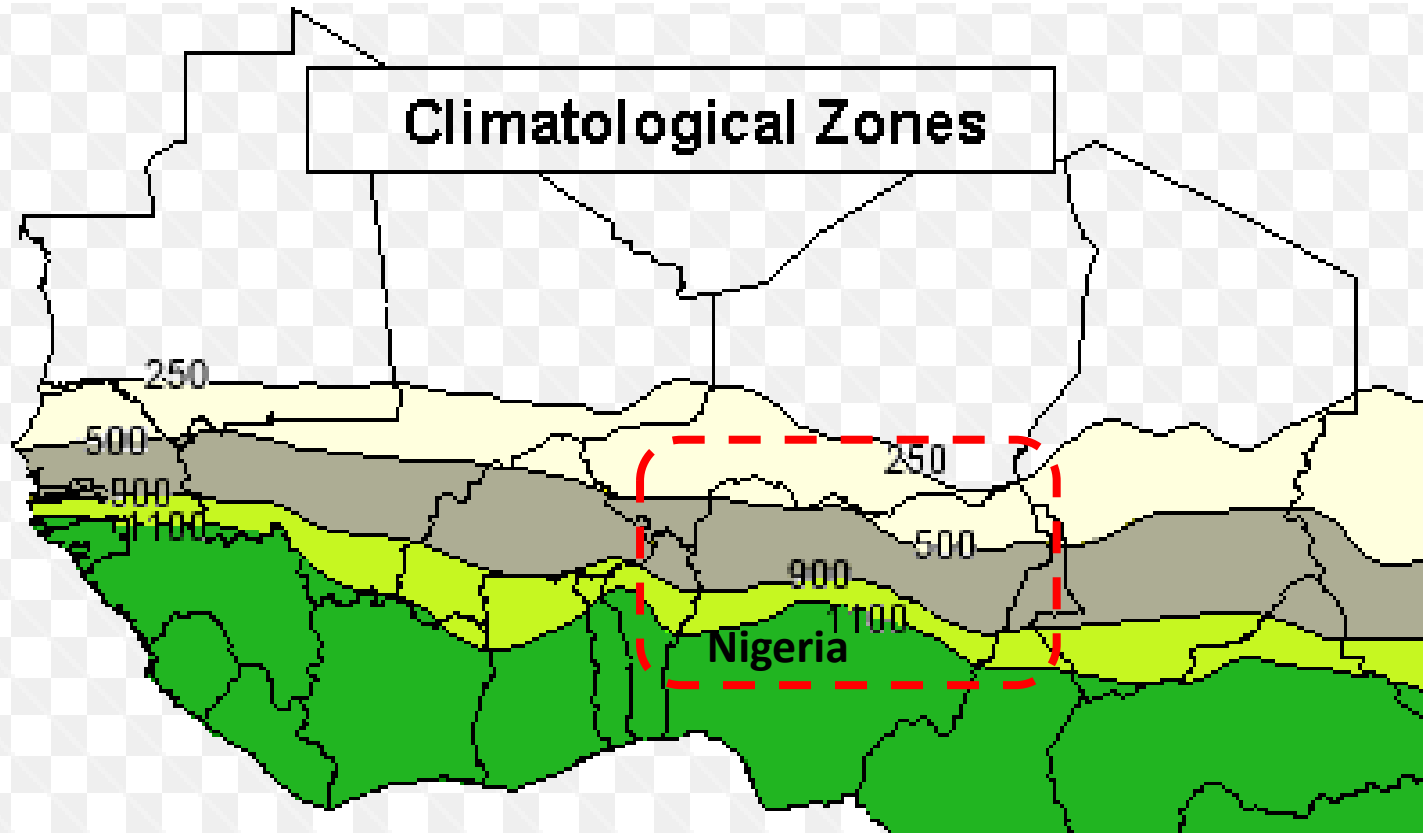

# Contents

- **Introduction**
  - **Research Objectives**
  - **Description of Study Area**
- **Materials & Methods**
- **Results and Discussion**
- **Conclusions**

# Introduction

- Climate Change
- **Sub-Saharan West Africa**- hardest-hit regions (IPCC, 2014)
- Due to its **marginal climate** and **high Population**
- Largest **semi-arid** regions in the world
- Rainfed agriculture & livestock farming are the primary source of **livelihoods**
- High intra-annual and inter-annual **rainfall variability**
- Affecting **water resources** and **food security**
- Severe droughts during the **1970-1980s**
- **30% decline** in rainfall between 1960-1990
- **1972-1974** and **1983-1985** are well known droughts years

# Agro-Climatic Zones of West Africa

[Source: FAO]

# Introduction

- Nigeria 7<sup>th</sup> most **populous** country
- Previous studies report great spatial variation in rainfall amounts and trends (**Buba, 2010; Mortimore, 2000; Tomlinson, 2010**),
- Rainfall in Northern Nigeria formed by **convective clouds** (vary over a few tens of km)
- Spatial distribution of rain gauges is very **sparse**
- **Satellite based** rainfall estimates are alternative to **sparse gauge based** rainfall

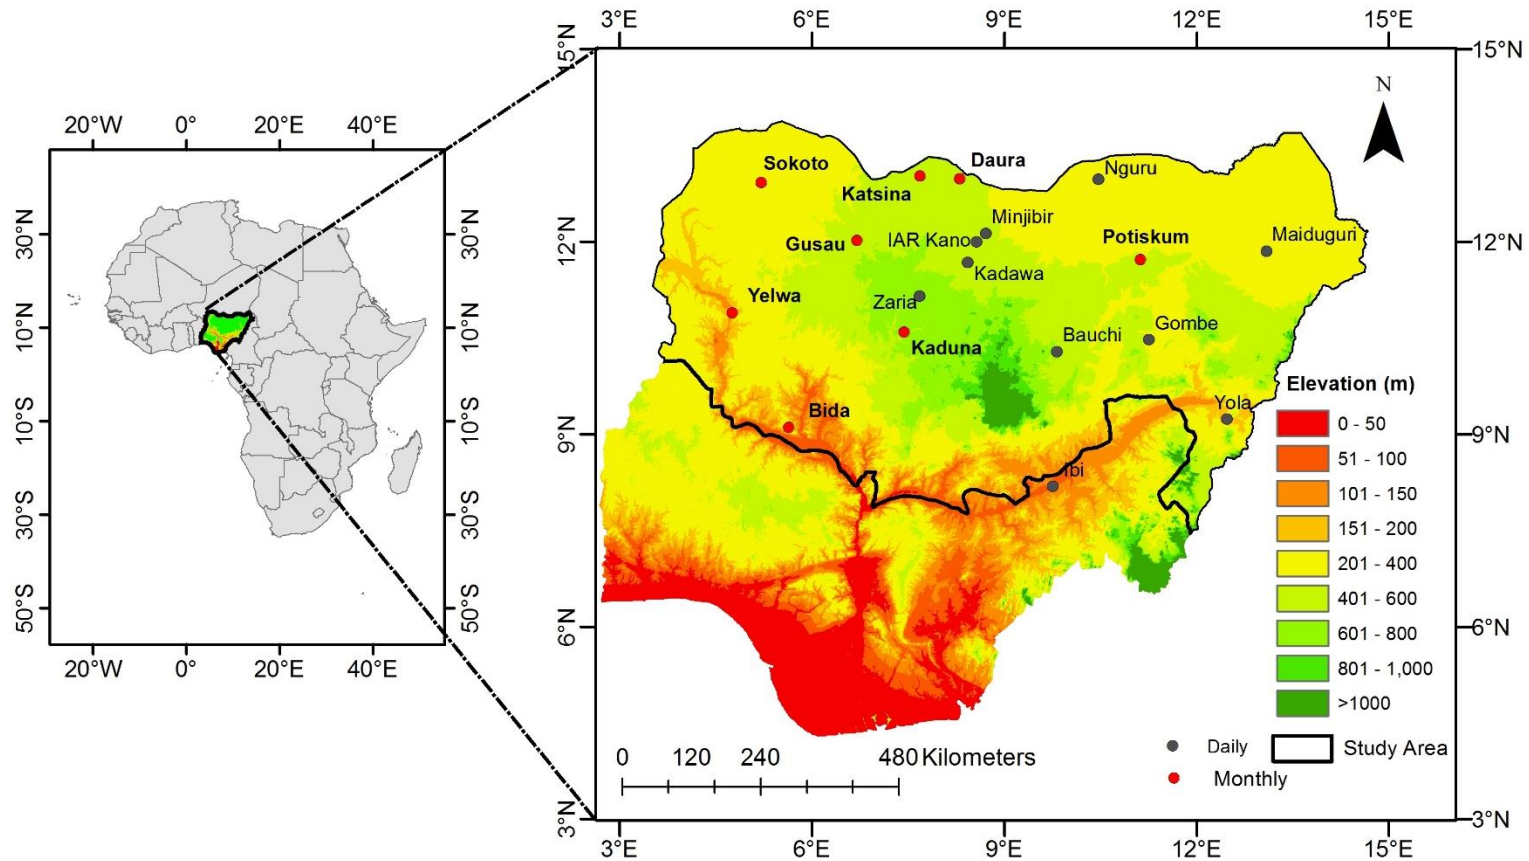

# Rainfall Variables Specific to Crop Production

- **Water availability** and **timing** of rainfall events are key factors for the **agricultural crop production**
- None detailed study for different **rainfall variables** specific to **crop production**
- To better characterize **changes in rainfall regime** we used **seasonal rainfall variables** based on daily rainfall data
- Onset, Cessation, Length, Seasonal rainfall amount, Number of rainy days of different intensity, number and mean length of dry spells in a rainy season

# Research Objectives

- Evaluation of satellite-based rainfall datasets relative to ground stations at daily, dekadal (10 days), monthly and annual time scales
- To evaluate satellite rainfall products for retrieval of seasonal rainfall variables
- To analyse temporal trends over a 30-year period (1984-2013)

# Description of Study Area

# Materials & Methods

# Satellite Rainfall Products

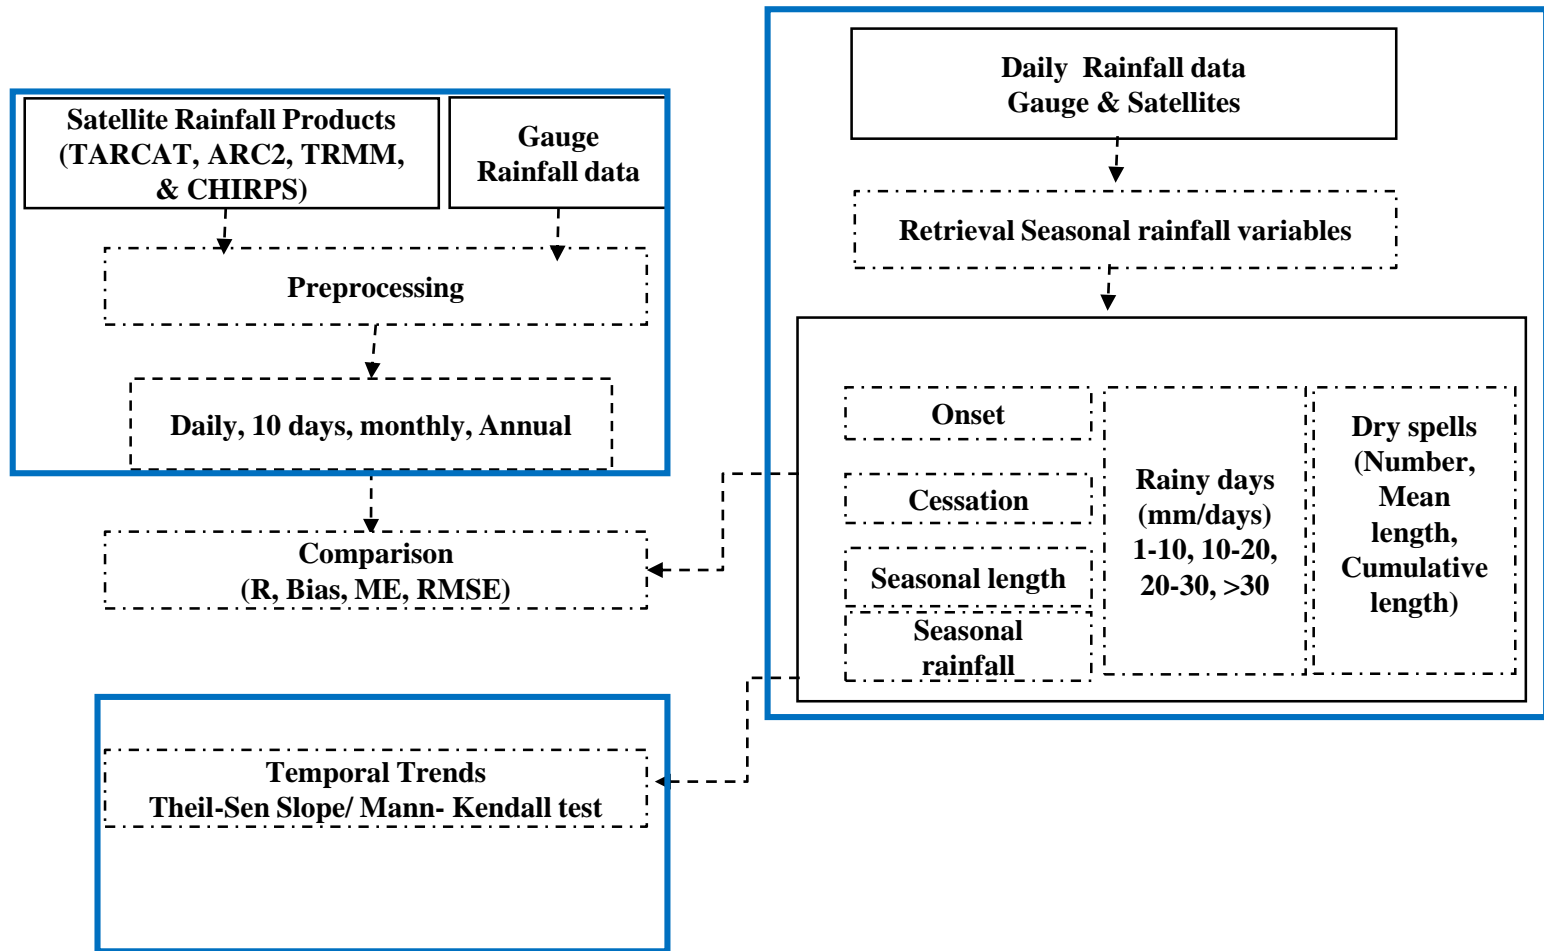

Satellite rainfall products	Temporal coverage	Data Input	Spatial Coverage	Spatial resolution	Temporal resolution
TARCAT Version 2.02	1983-2015	TIR, gauge	Africa	0.0375° (~4 km)	Daily
CHIRPS Version 2.01	1981-2015	TIR, gauge	Global	0.05° (~5 km)	Daily
ARC Version 2	1983-2015	TIR, gauge, TMPA 3B42 v7	Africa	0.1° (~10 km)	Daily
TRMM Multi-satellite Precipitation Analysis version 7 (TMPA 3B42 v7)	1998-2014	TIR, VIS, TMI, PR, gauge	Global	0.25° (~25 km)	Daily

# Summary of Rainfall variables

Rainfall Variable	Definition
<b>Onset of Rainy Season</b>	<b>First occurrence of <math>\geq 20</math> mm cumulative rainfall with 7 days after May 1, Followed by at least 20 mm rainfall in next 20 days to avoid “false start”</b>
<b>Cessation of Rainy Season</b>	<b>Occurrence of 20 consecutive days with cumulative rainfall less than 10 mm after September 1</b>
<b>Length of Rainy Season</b>	No. of days between the Onset and the Cessation of rainy season
<b>Season Rainfall Amount</b>	Rainfall amount during the rainy season
<b>Total No. of Rainy days</b>	No. of rainy days (rainfall amount $\geq 1$ mm/day) b/w onset and cessation
<b>No. of Rainy days with 1-10, 10-20, 20-30, &gt;30 mm Rainfall</b>	No. of rainy days of different rainfall intensity during rainy season
<b>No. and mean length of dry Spells</b>	Dry spell is defined as rainfall below 1 mm in at least seven consecutive days

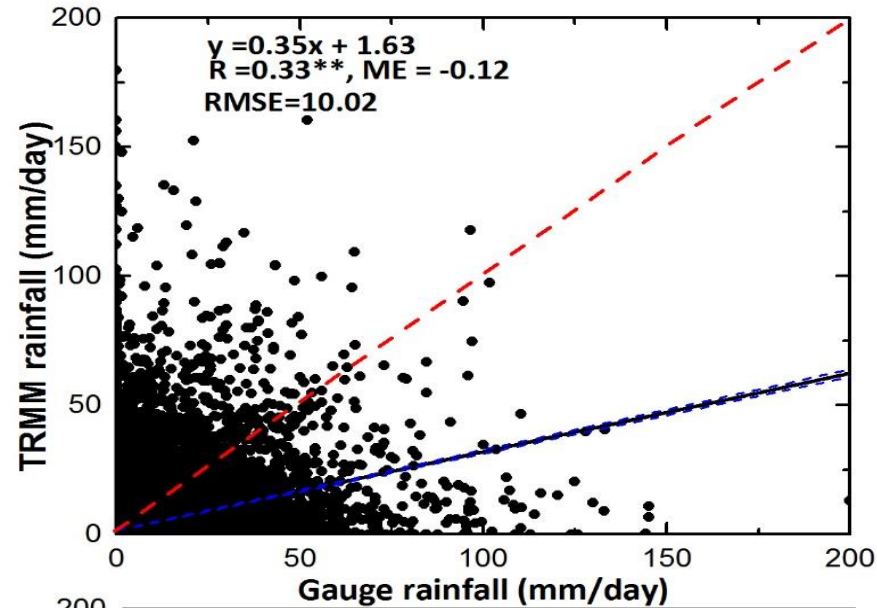

(Zhang, et al., 2017)

# Methodology

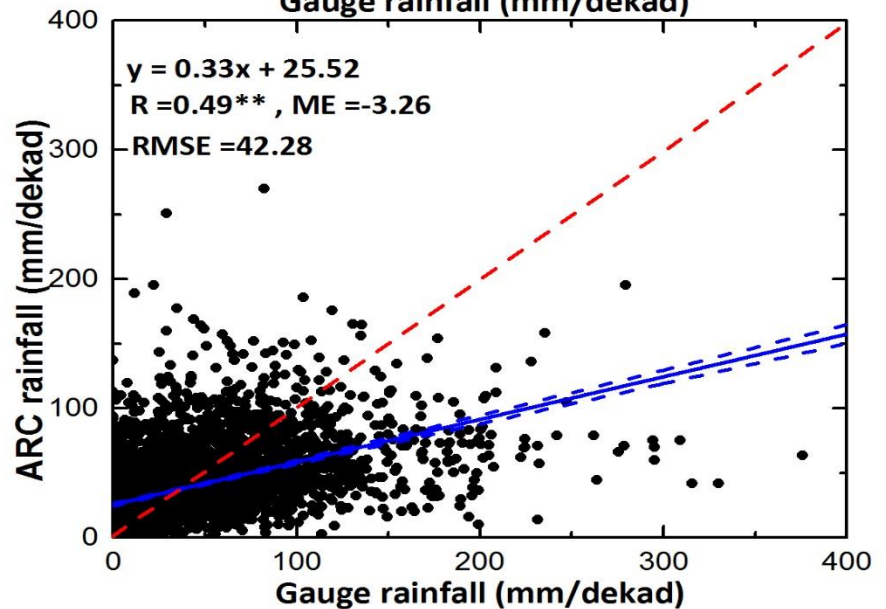

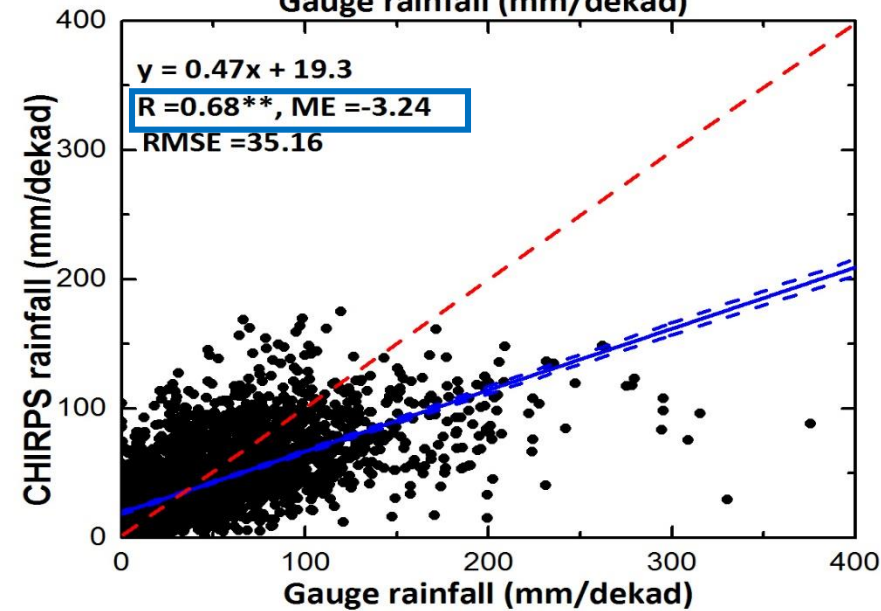

# Results & Discussions

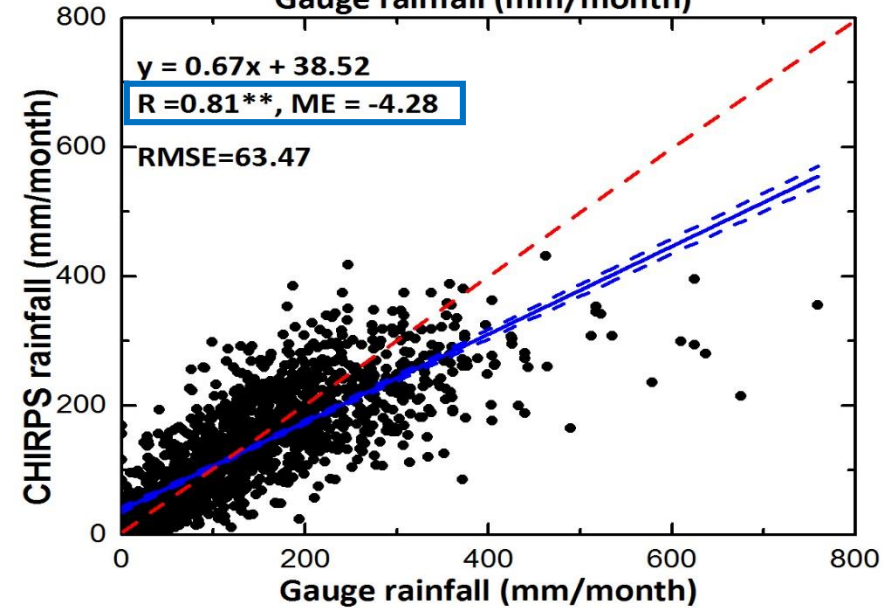

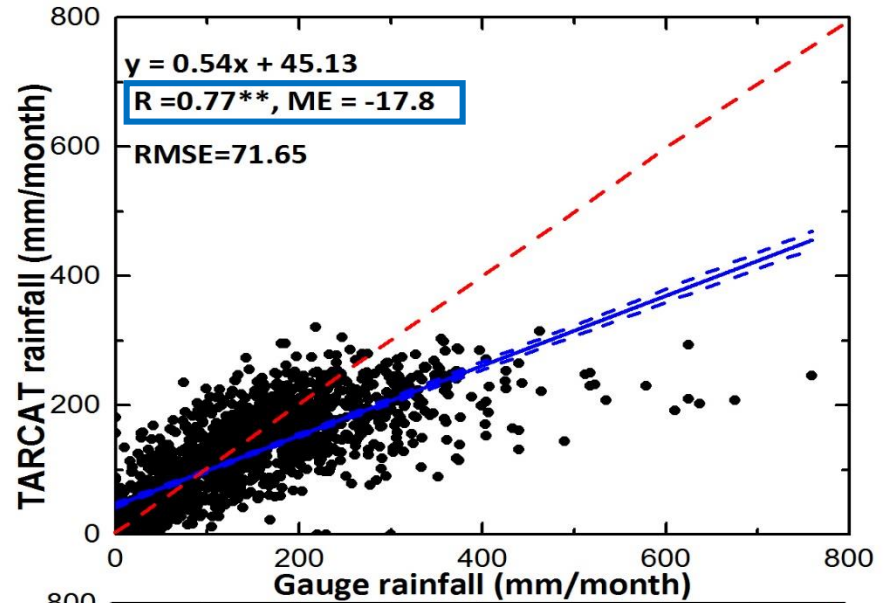

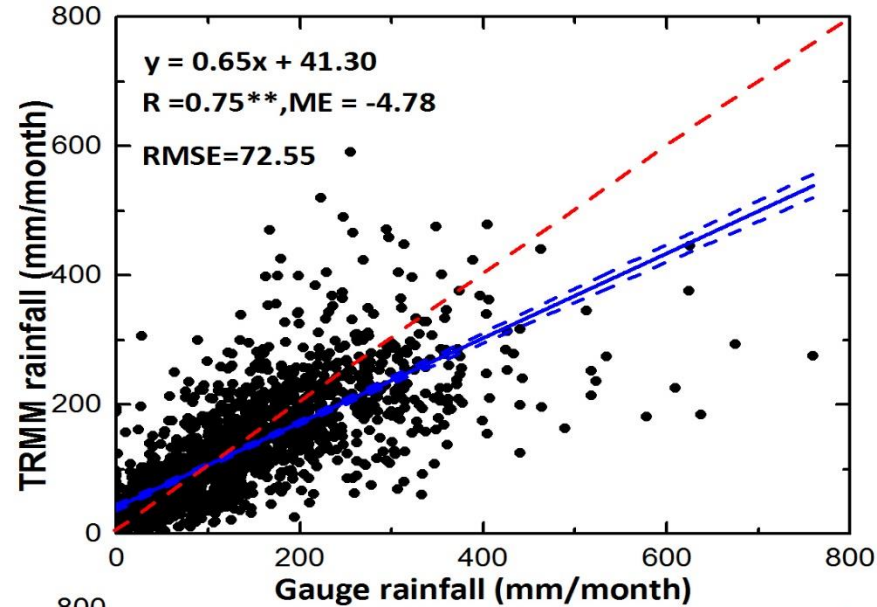

# Daily Rainfall Comparison

# Dekadal (10 days) Rainfall Comparison

# Monthly Rainfall Comparison

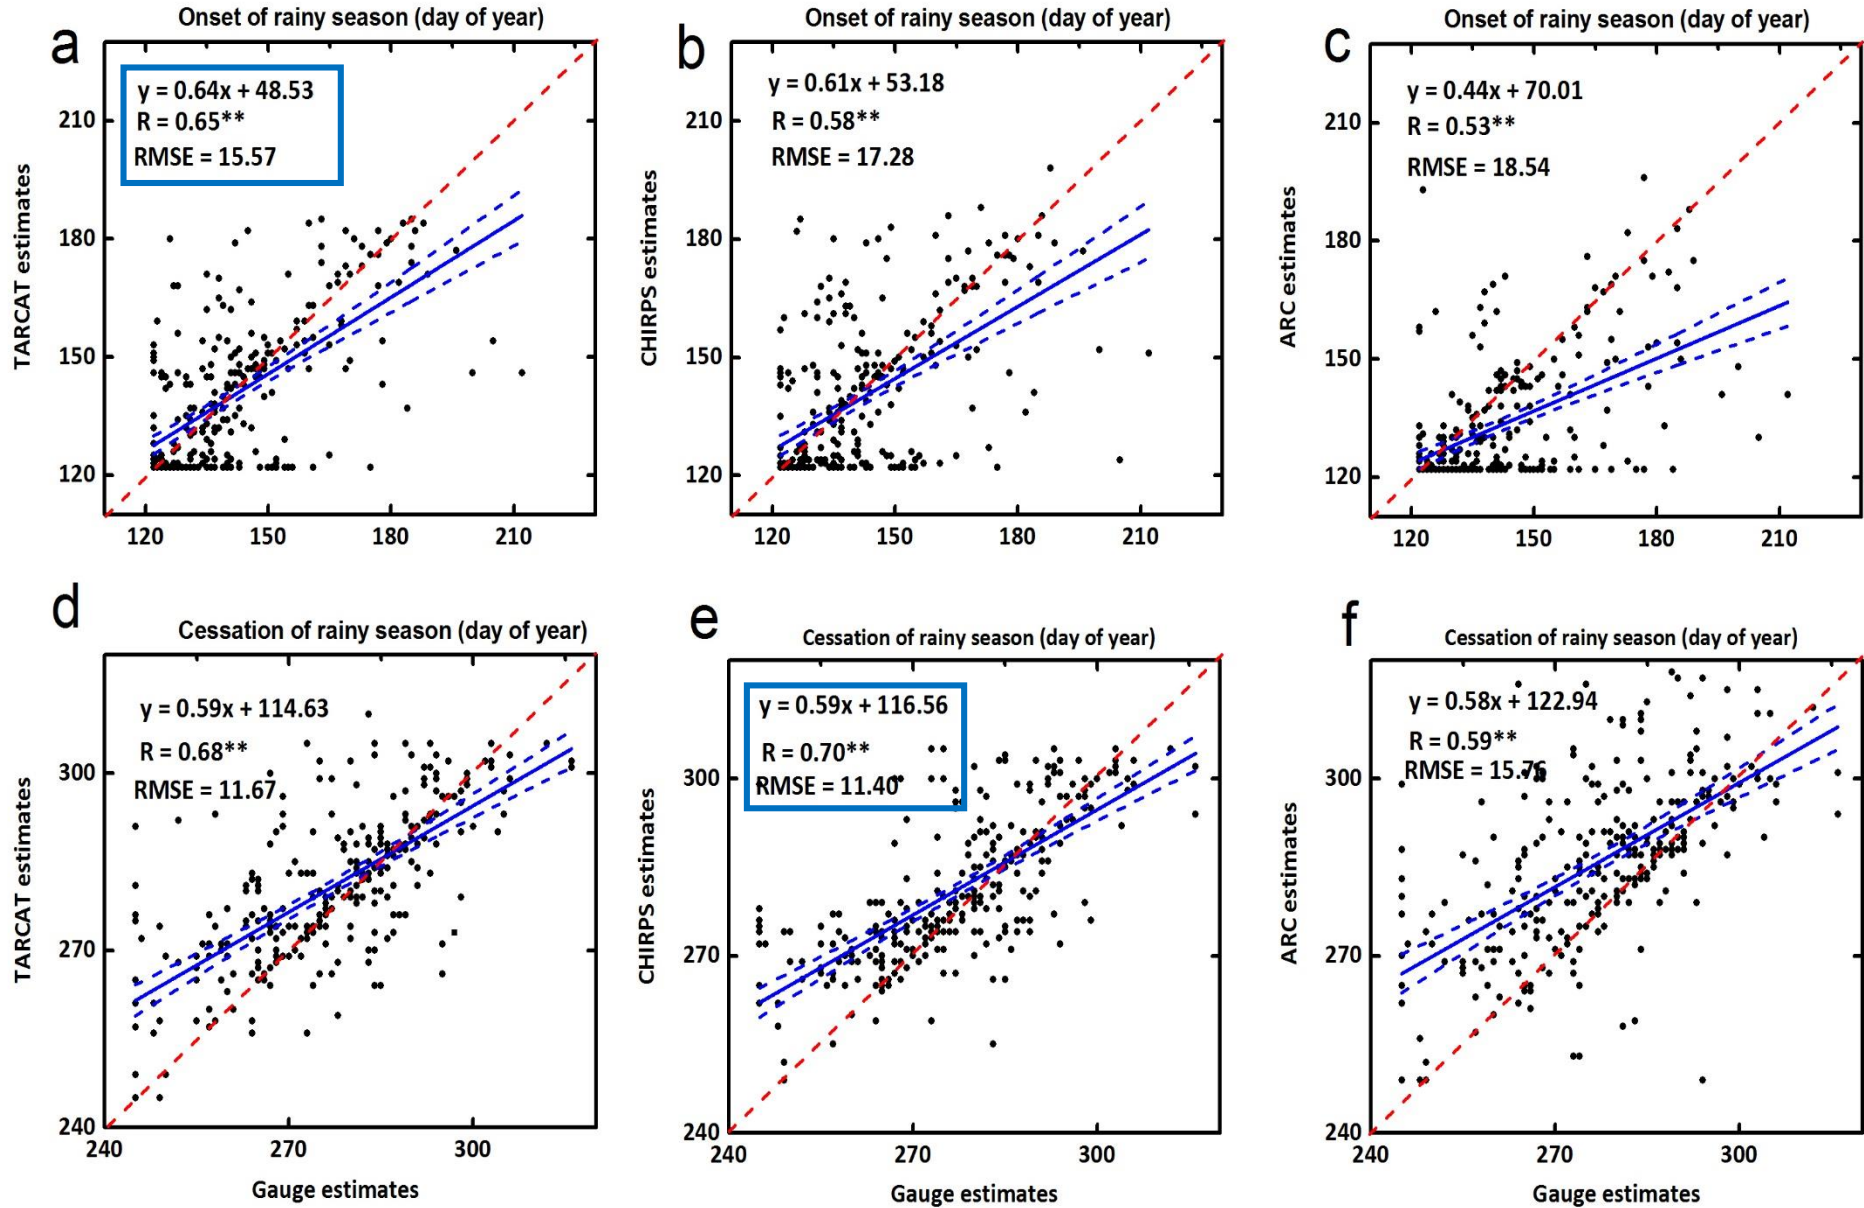

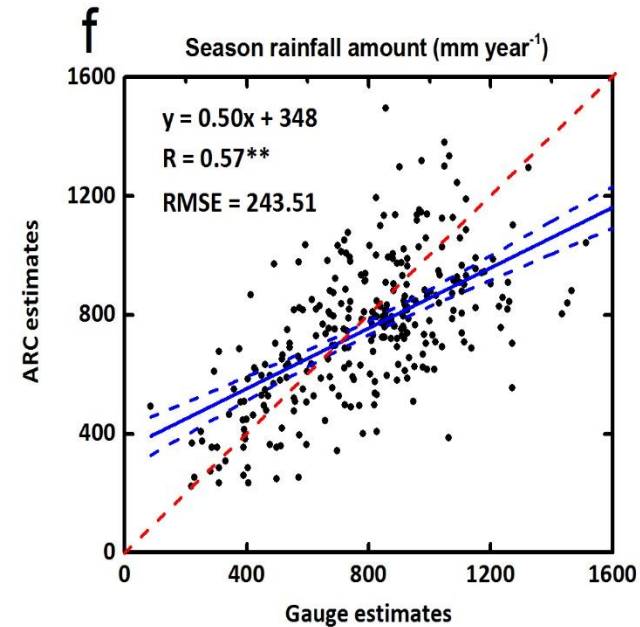

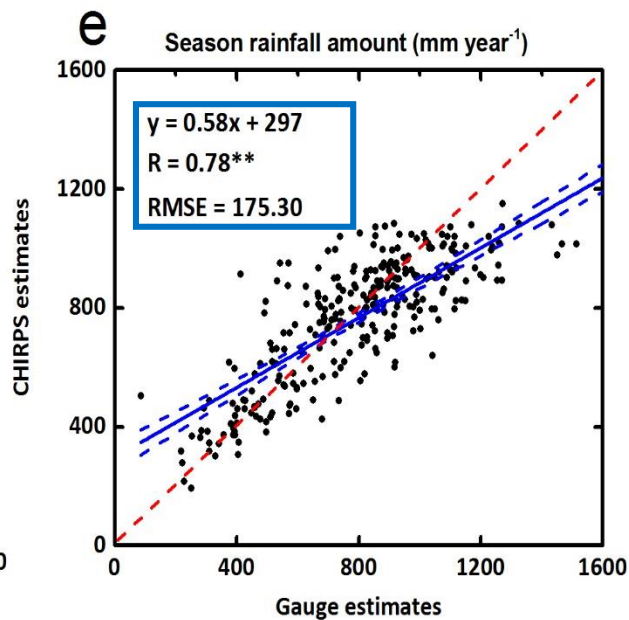

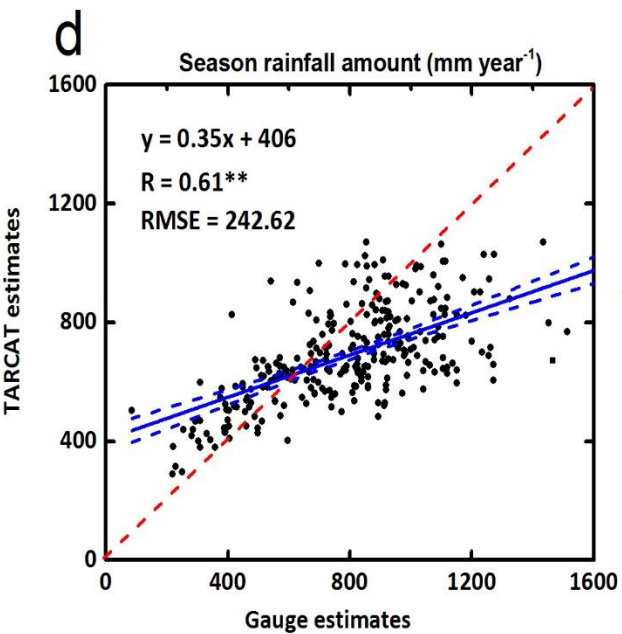

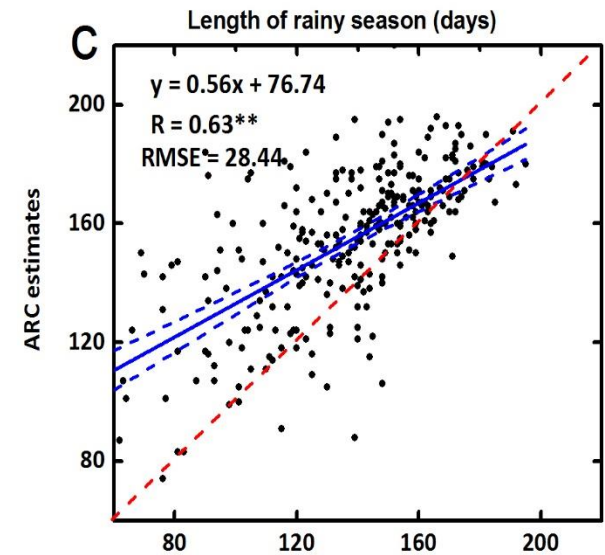

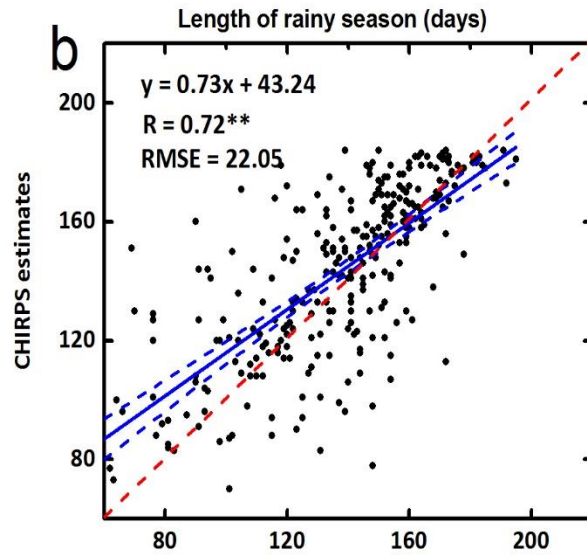

# Annual (seasonal) Rainfall Comparison

	TRMM	TARCAT	CHIRPS	ARC
Correlation (R)	0.75**	0.69**	0.79**	0.62**
Bias	0.97	0.84	0.97	0.93
Mean Error (mm/season)	-29.7	-141.3	-27.387	-58.7
RMSE (mm/season)	214.3	273.9	196.6	264.4

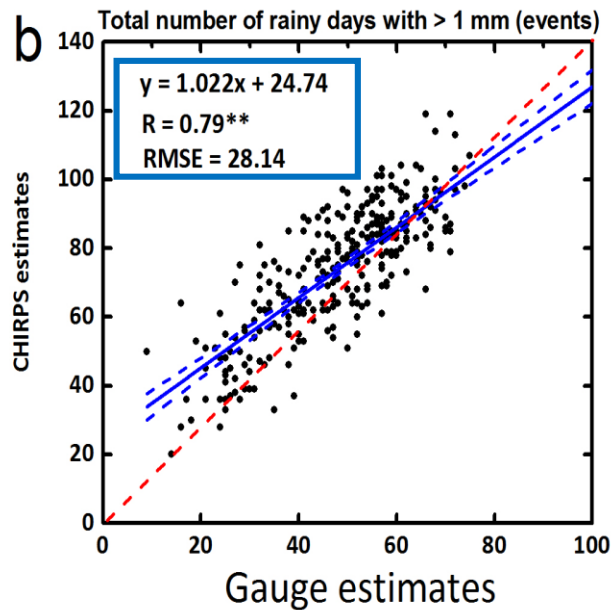

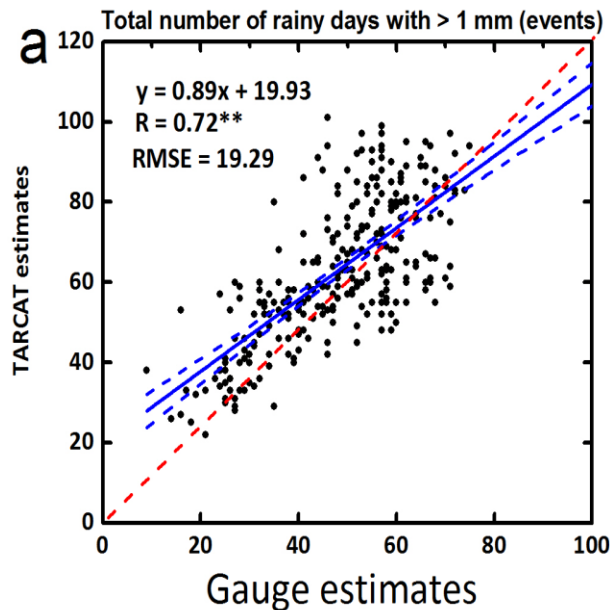

# Onset and Cessation of Rainy Season

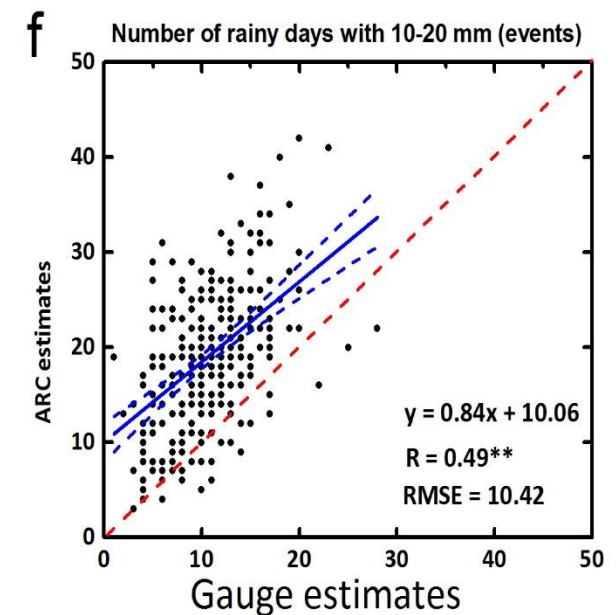

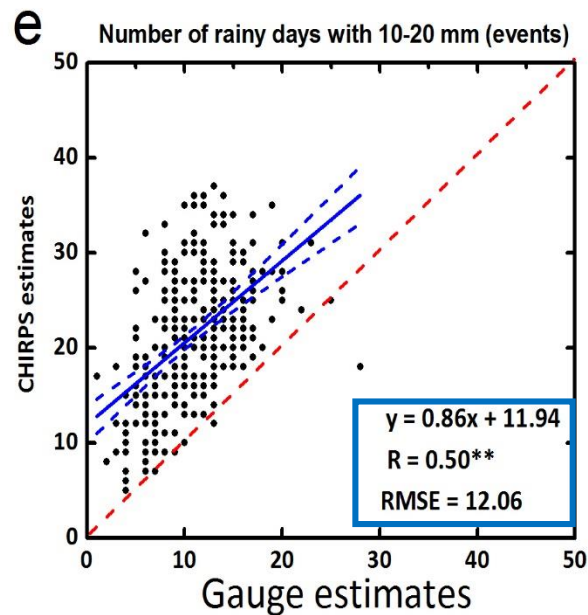

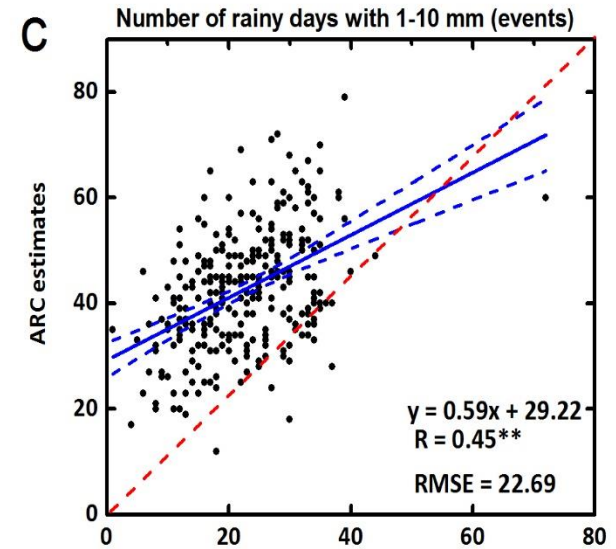

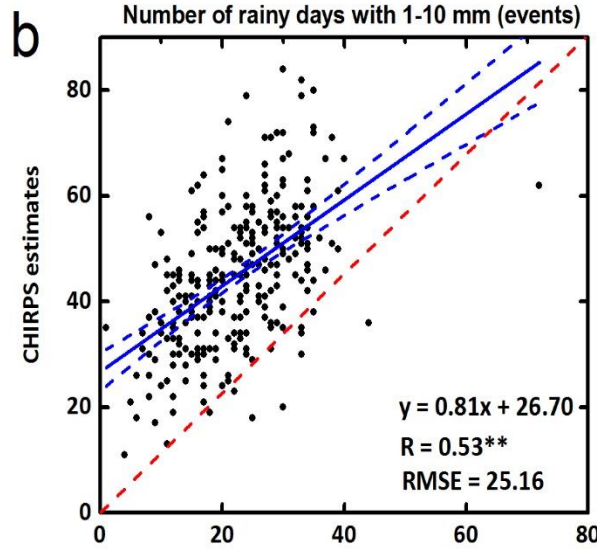

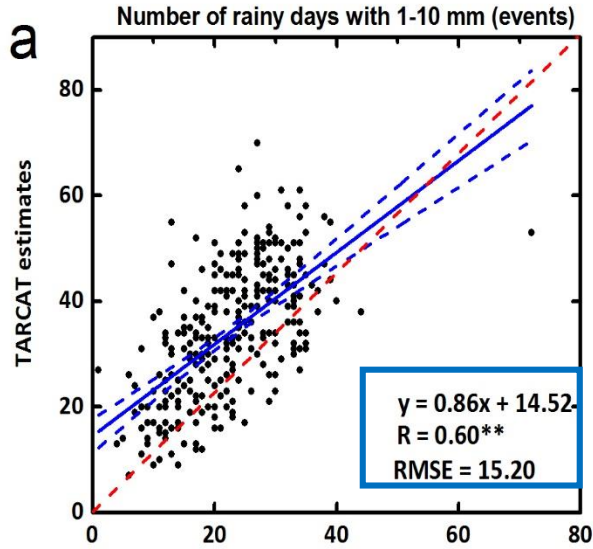

# Length and Season Rainfall amount

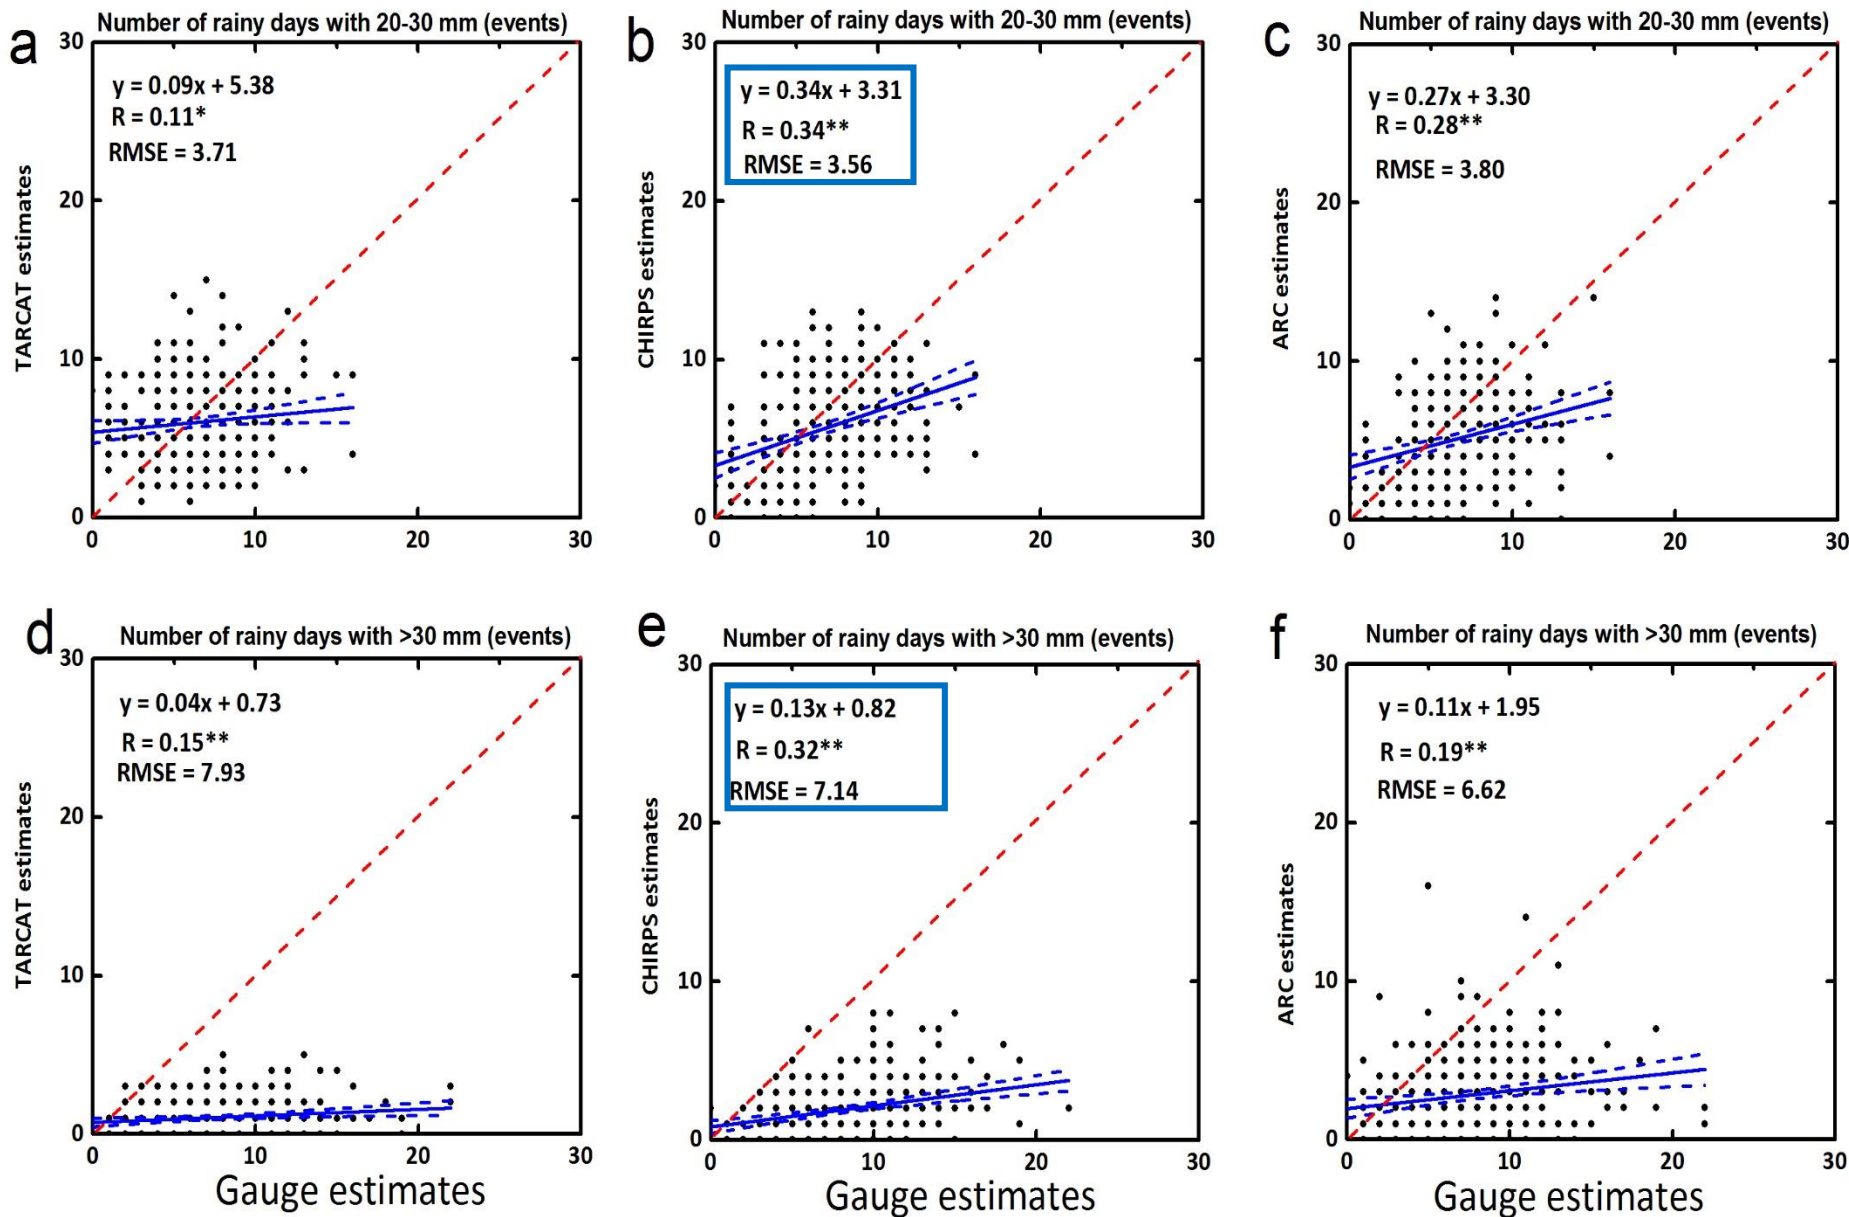

# Total Number of Rainy Days with $\geq 1$ mm Rain

# Rainy Days with 1-10 and 10-20 mm Rain

# Rainy Days with 20-30 and >30 mm Rain

# Temporal trends for Gauge rainfall variables (1984-2013)

Season rainfall variables	Gauge- trends
Onset of Rainy Season (day of year)	-0.18
Cessation of Rainy Season (day of year)	0.44*
Length of Rainy Season (days)	0.53*
Season rainfall amount (mm year <sup>-1</sup> )	8.2**
Total no. of rainy days with > 1mm (days)	0.18 <sup>+</sup>
No. of rainy days with 1-10 mm (days)	0
No. of rainy days with 10-20 mm (days)	0.02
No. of rainy days with 20-30 mm (days)	0.02
No. of rainy days > 30 mm (days)	0.11**
Cumulative dry days	0.21
Length of Dry Spell (days event <sup>-1</sup> )	0.03
Number of Dry Spells (events year <sup>-1</sup> )	0.002

Statistically significant levels (+= $p \leq 0.1$ , \* = $p \leq 0.05$ ; \*\* = $p \leq 0.01$ ; \*\*\* = $p \leq 0.001$ )

# Temporal trends for Monthly Rainfall (1984-2013)

Months	March	April	May	June	July	August	September	October
Trend Slope	-0.08**	-0.06	-0.07	0.74**	0.78	2.22**	1.40 <sup>+</sup>	1.05**
Contribution to annual rainfall (%)	0.37	2.28	7.90	13.46	23.36	30.25	18.24	4.10

# Conclusions

# Conclusions

- **CHIRPS** shows **relatively best results** for Northern Nigeria followed by TARCAT
- **Recovery** in rainfall is mainly related to
  - Increase in total number of rainy days
  - Later Cessation of rainy season
  - Good implications for Sorghum crop
  - A higher number of extreme rainfall events
- **Not related to**
  - Earlier onset of rains nor
  - Reduction in number of dry spells

# Acknowledgments

## I would like to thank

- **RGC Hong Kong** (PhD Fellowship)
- NIMET, IAR, ICRISAT (Data Sharing)
- People and stakeholder of Nigeria

**Thank You**
