

Geospatial Technologies for Flood Hazard Assessment in Pakistan

Muhammad Farooq, Ahmed Haseeb Rabbani

SUPARCO

Ref: UNESCO Project Phase-I

Space Application Centre for Response in Emergency and Disasters (SACRED)

- The centre provides **space based information** to national / provincial disaster management agencies
- Rapid assessment of the **extent of natural disasters** and damages to human lives, property and infrastructure.
- The centre also provides assistance to regional countries in case of natural disasters.

Web: disasterwatch.sgs-suparco.gov.pk

Sequence of presentation

- Background
- Hydrological cycle overview
- Hydrological model classification
- Rainfall-runoff-inundation (RRI) model
 - Model overview
 - Input data requirements
- RRI model for indus river basin
- Flood Hazard Maps
- Conclusion

An aerial photograph showing a vast, flat landscape completely inundated with muddy brown floodwater. The water covers almost the entire ground, leaving only small, irregular islands of green vegetation and some small structures or buildings. The horizon is visible in the distance under a clear, light blue sky. The word "Background" is written in a bold, yellow, sans-serif font, centered horizontally and slightly above the vertical center of the image.

Background

Flood 2010 at Guddu Barrage

Flood 2010 at Sukkur Barrage

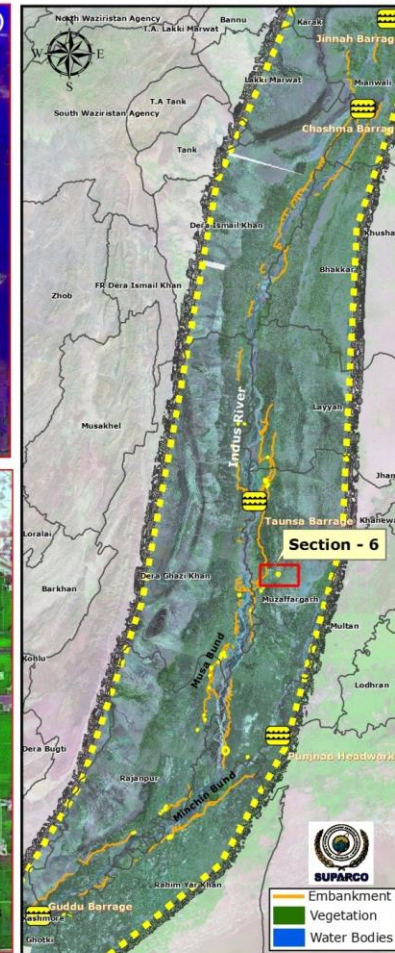

Flood 2010 – Breaches in District Muzaffargarh

Delineation of Breached Areas - District Muzaffargarh

Section 6

Area Defined in TOR

Basic Concepts

The Water Cycle

Hydrological Modeling Classifications

1D Model

Can model flow as far as it remains within channel or flows parallel to the channel

Ex. HEC-RAS 1D, MIKE11, SOBEK 1D etc

2D Model

Can model overland flow

Ex. HEC-RAS 2D, MIKE21, SOBEK 2D, RRI etc

1D/2D Couple Model

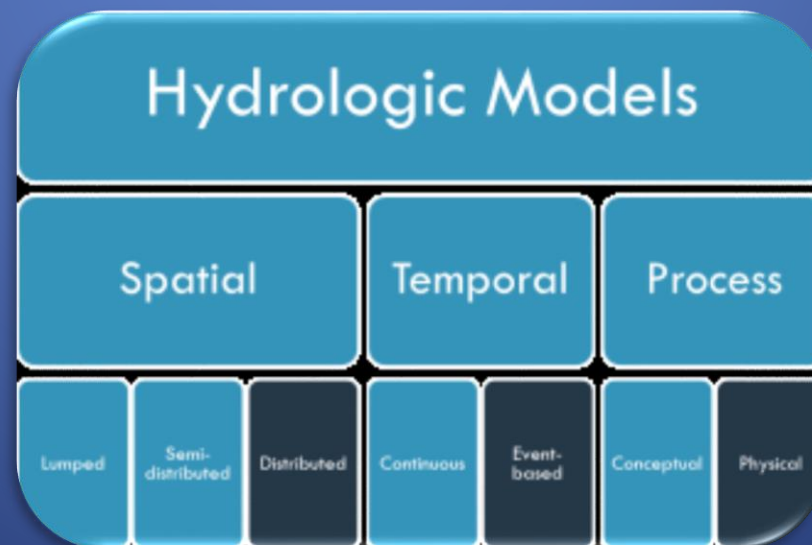

Can model flow within channel with 1D approach while overland flows with 2D

Ex. RRI, HEC-RAS 1D/2D, MIKE Flood etc

Rainfall-runoff-inundation (RRI) Model

RRI model is a 2-Dimensional Inundation Model based on diffusion wave approximations – can simulate rainfall-runoff and flood inundation simultaneously.

- ✓ Rainfall-Runoff
 - ✓ Flood Routing
 - ✓ Inundation
- Integrated
Simple
Physically Sound

How to Make Flood Hazard Maps?

- Community based
- Past Event : display past flood event (e.g. remote sensing)
- **Simulation model based**

1D hydraulic model (e.g. HEC-RAS)

Indus River

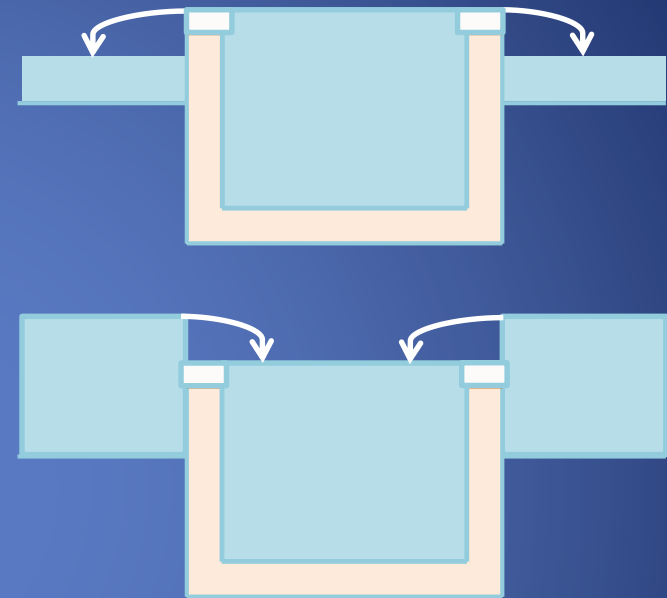

for diffusive-type inundation
2D hydraulic model

1D river routing + 2D inundation interaction model

e.g. **Rainfall-Runoff-Inundation Model**

Rainfall-Runoff-Inundation (RRI) Model

- **Diffusion Wave Approximations**

- 1D in River
- 2D in floodplain

- **Subsurface flow**

- Vertical Infiltration with Green-Ampt
- Saturated Subsurface + Surface Flow

- **Rectangular river cross sections**

- Width, Depths, Levee heights can be assigned for each river grid-cells

- **Over-topping and step-down** formulae are used to compute the interactions between water in river and on slope

- **Water depth and discharge boundary conditions** can be wet at any grid-cell

Case Study
River Indus Flood Modeling
UNESCO Phase-I

Study Area

Indus is categorized as a 'Poorly-gauged' basin.

- ✓ Poor **rain gauge density**, coarse temporal resolution
- ✓ **Few discharge gauge stations** on tributaries
 - Large number of sub-catchments have no discharge gauge stations
- ✓ Highly **heterogeneous topography** and **soil characteristics**
- ✓ Area = $\sim 340,000 \text{ km}^2$

Geographic Datasets for RRI

River and levee locations

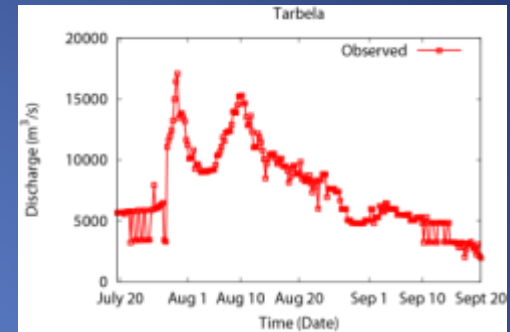

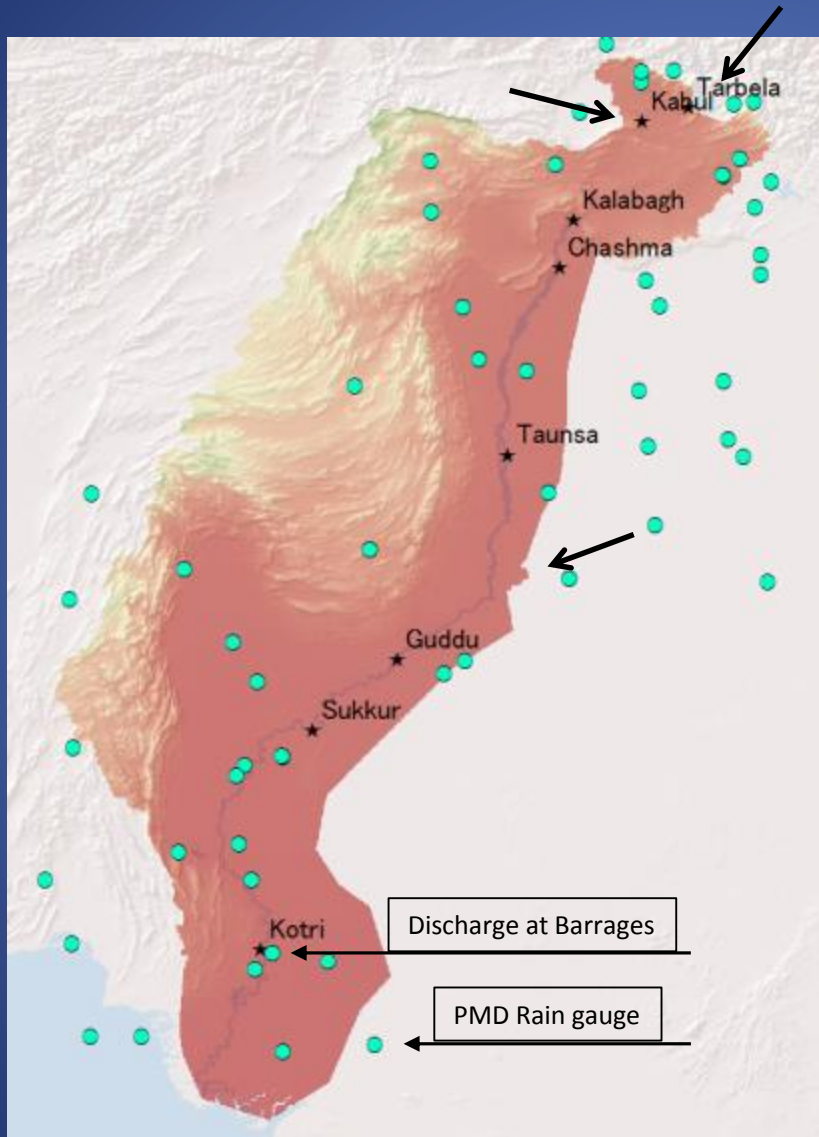

HydroSHEDS / SUPARCO

Land cover

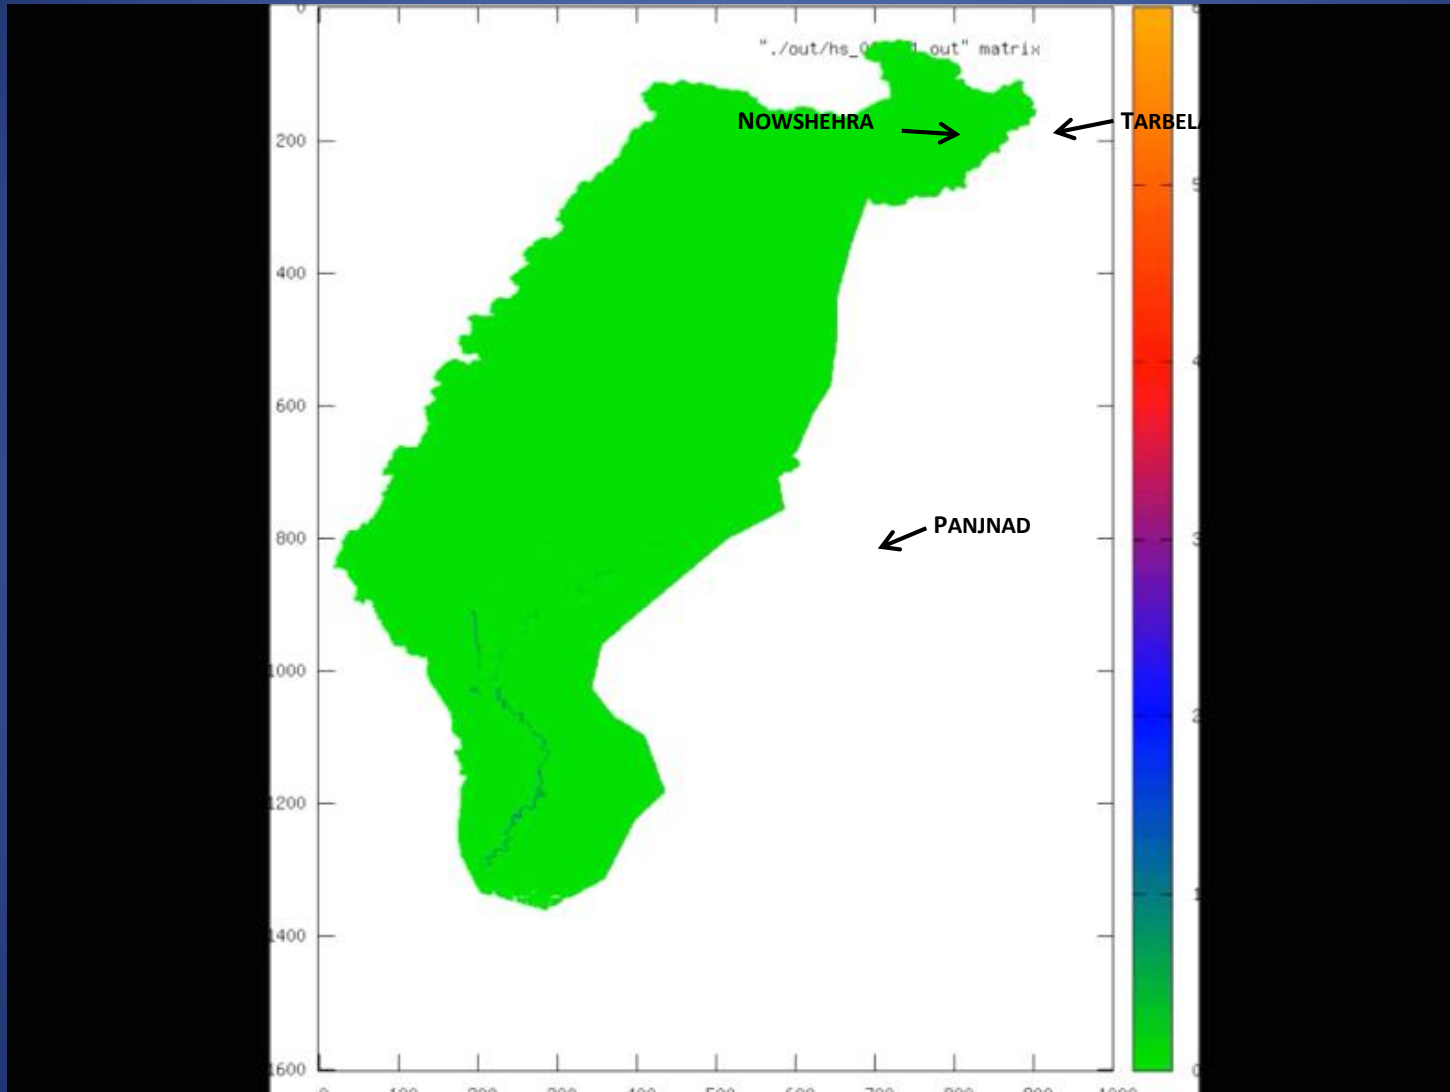

GLCC v2

Rainfall and Discharge Data Locations

Discharge Boundary Conditions from 2010

RRI simulation of 2010 floods

Hazard Mapping at the lower IRB

- Use **Kalabagh** and **Guddu** as the discharge reference points
- Use 2010 as the shape of synthetic hydrographs

Kalabagh Peak Discharge [$\times 10^3$ cusec]

	500	700	897	1100
No Break	○	○	○	○

Guddu Peak Discharge [$\times 10^3$ cusec]

	600	800	1148	1400
No Break	○	○	○	○
Br 1			○	
Br 2			○	
Br 3			○	

2010 Flood

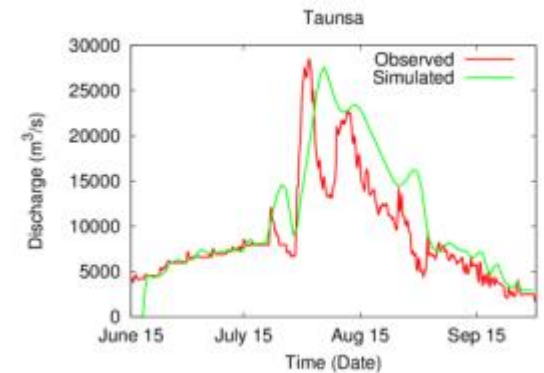

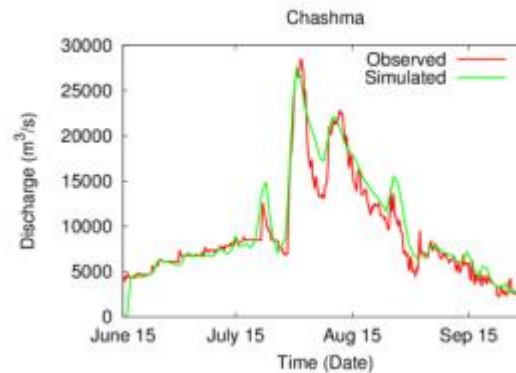

E.g. Synthetic Hydrographs at Guddu

(Rainfall record in 2010 is used for all the scenarios)

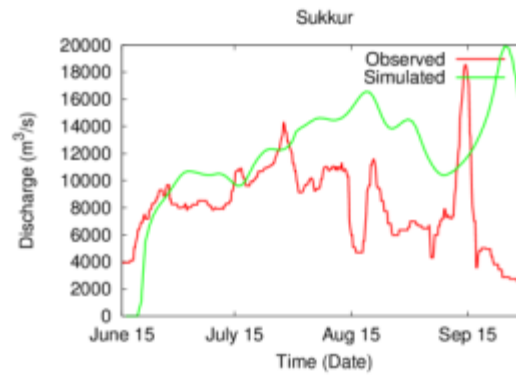

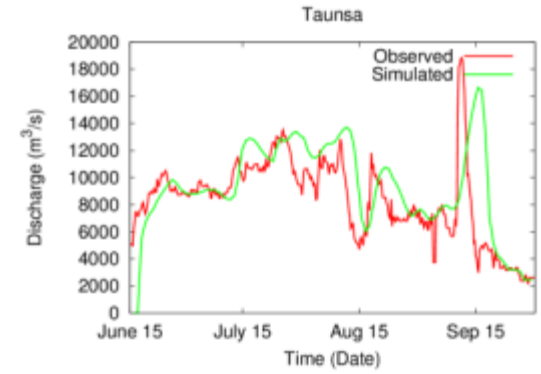

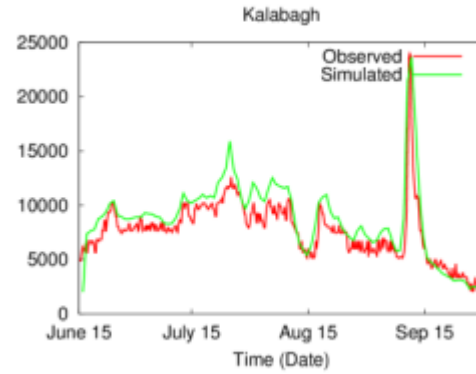

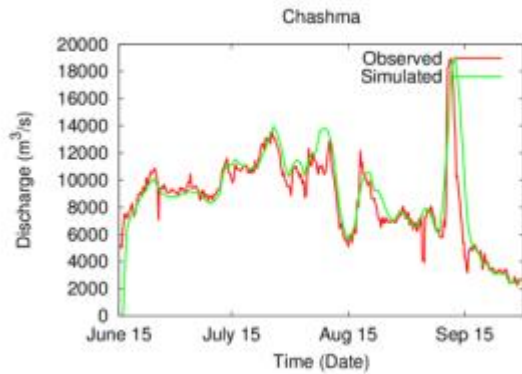

Discharge Hydrographs of 2010 Flood Event

Peak Discharges : OK

Arrival Time : Late

Discharge Hydrographs of 1992 Flood Event

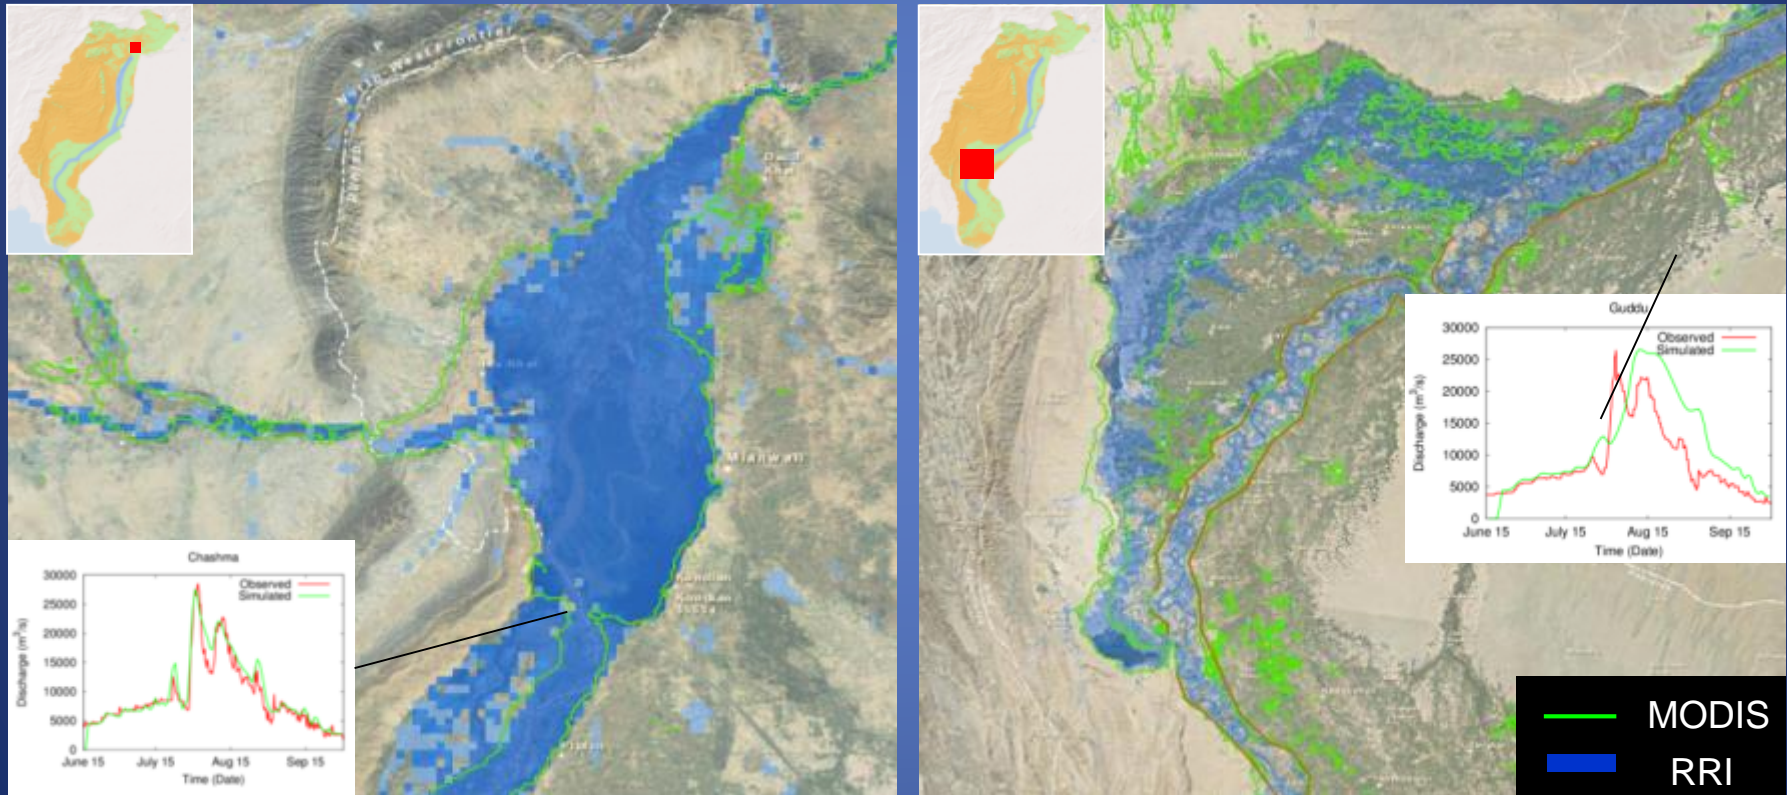

Peak Discharges : OK

Arrival Time : Late

Model calibration and validation

- Calibrate with 2010 Flood
- Validate with 1988, 1992, 1994, 1997

Model calibration and validation

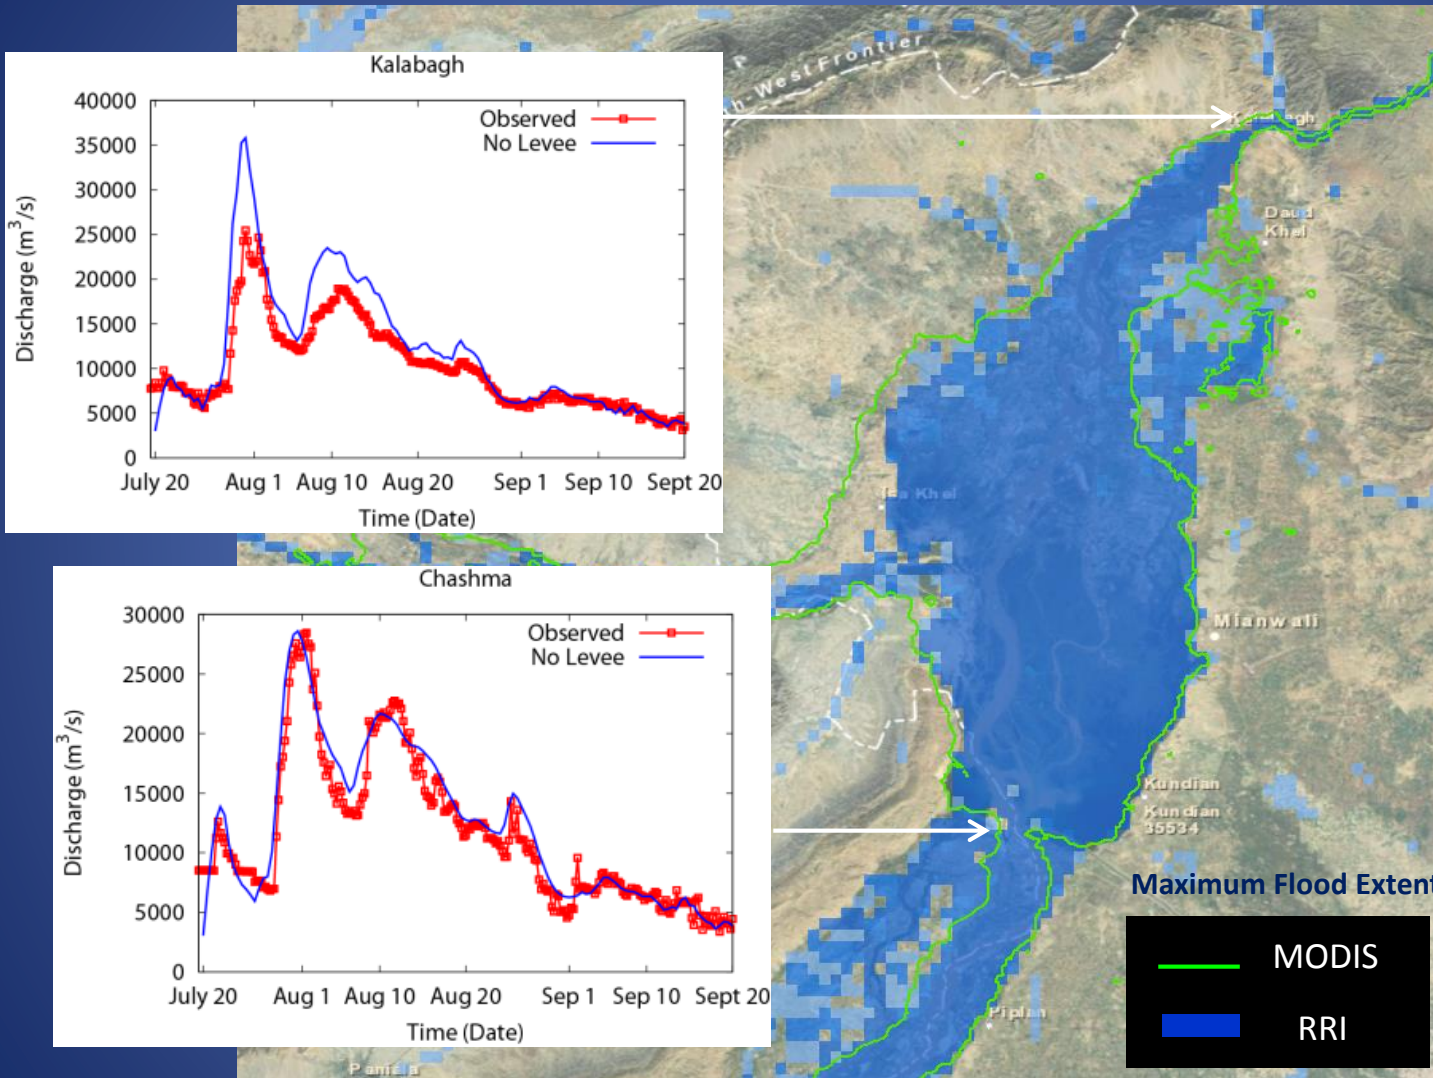

Maximum simulated inundation extent for 2014 around Trimmu and Athara Hazari.

Devastation caused by 1992 floods around Trimmu and Athara Hazari.

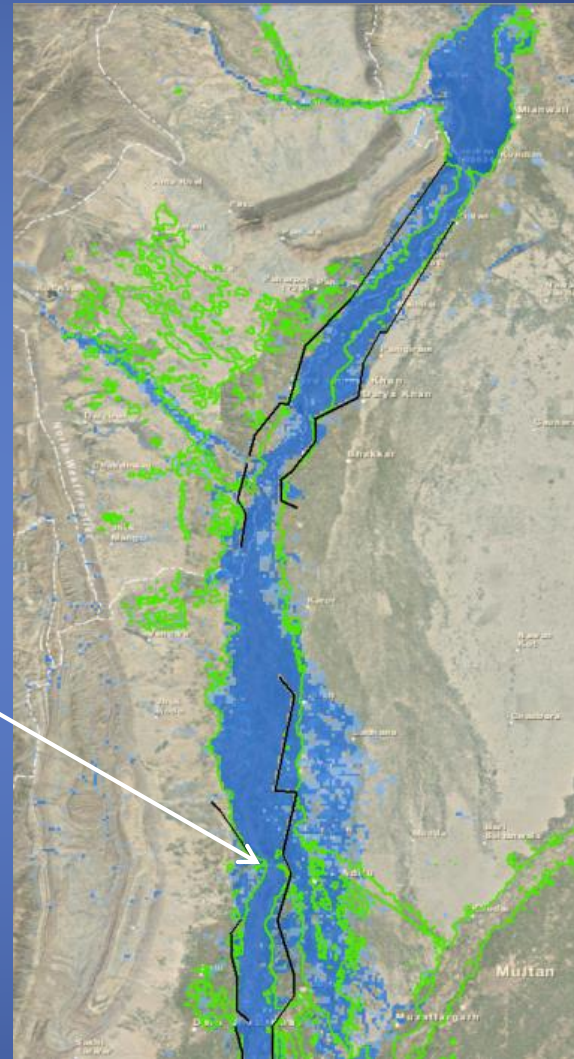

Model calibration and validation

Tarbela - Kalabagh
200 km, 1/1400

Kalabagh - Chashma
60 km, 1/3100

Model calibration and validation

Model calibration and validation

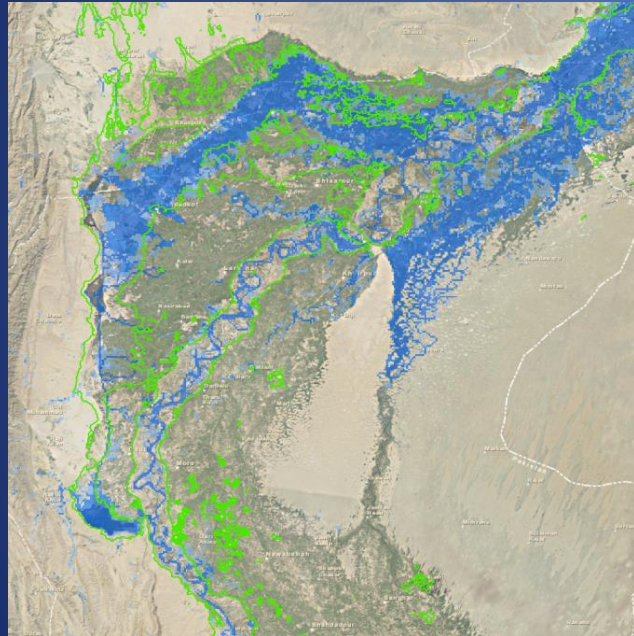

Taunsa - Guddu
290 km, 1/4900

Guddu - Sukkur
130 km, 1/11800

Flood hazard mapping Ver 1.0

DISTRICT MIANWALI

Flood Hazard Map - Maximum Historical Simulated Flood (2010)

	District Boundary	
	Tehsil Boundary	
Flood Risk		
	Low (0.5-2.0 m)	539.27 Sq.Km
	Medium (2.1-4.0 m)	550.2 Sq.Km
	High (Larger than 4m)	155.25 Sq.Km
Inundated Infrastructure		
	BHU	3
	School	0
	Roads	962.1 Km
	Settlements	1087
	Agriculture	599.7 Sq.Km

This hazard map has been generated using flood extent simulated by Indus- IFAS.

Projection: UTM Zone 42 N
Datum: WGS84

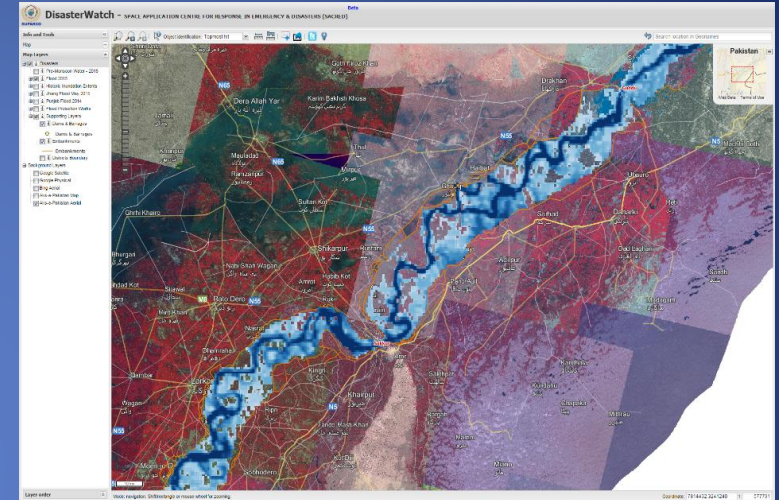

Flood hazard mapping Ver 2.0

Hydrological modeling applications

Beyond the UNESCO Project Ph-1

01-September-2014_12:00

SUPARCO HAS THE CAPACITY TO CARRY OUT FLOOD MODELLING AND PROVIDE INUNDATION FORECASTING BASED ON HYDROLOGICAL MODELLING FRAMEWORK (INDUSIFAS) AND REAL-TIME DISCHARGE INFORMATION.

Simulation results show how flood waters progress along Jhelum and Chenab rivers causing heavy inundations. Darker blue represents deeper inundations

Conclusion

- RRI model was applied to the lower IRB
- Large-scale flood inundation was well represented
- River discharge simulation was also reasonable (up to Guddu)
- RRI was used for Flood Simulation of 2015 and 2014 floods
- RRI model will be extended to River Jhelum, Chenab and Kabul Rivers in near future
- Two issues in the river flow simulations
 - Over estimates in the end of July 2010
 - Discharge at Sukkur and Kotri

Way Forward

- RRI model simulation with improved geometric data (30m DEM, Landcover, Embankment)
- Flood Hazard Maps for Chenab, Jhelum, Ravi, Sutlej and Kabul Rivers
